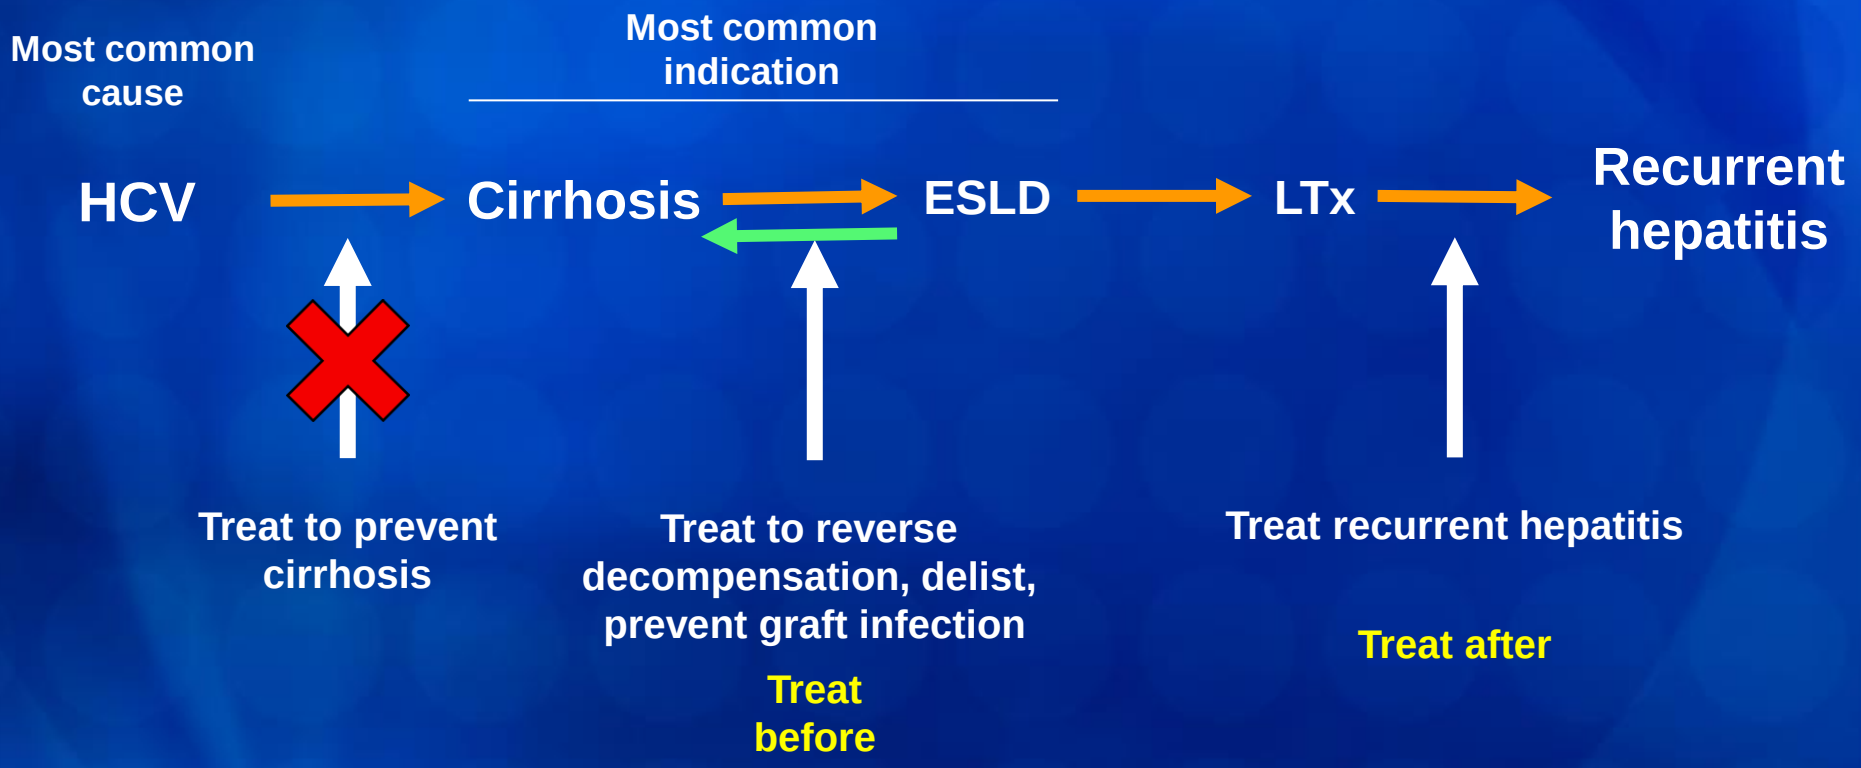
# How can we eliminate HCV from the transplant environment?

# How can we eliminate HCV from the transplant environment?

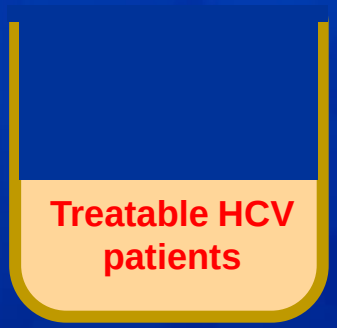


# DAAs have transformed management of HCV patients

**IFN-based therapy era**

**Patients ineligible for therapy**

- **Intolerant to IFN**
- **Intolerant to RBV**
- **Auto-immune hepatitis**
- **Severe heart disease**
- **Pregnant**
- **Mental health risk**
- **Severe hepatic dysfunction or decompensated cirrhosis**



**Chronic HCV-infected patients**

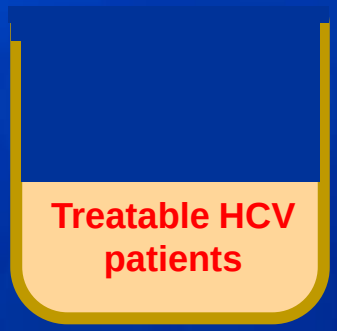
# We are now in the era where the majority of HCV-infected patients, including those with decompensated cirrhosis can be treated

2013 → 2017

## IFN-based therapy era

**Patients ineligible for therapy**

- Intolerant to IFN
- Intolerant to RBV
- Auto-immune hepatitis
- Severe heart disease
- Pregnant
- Mental health risk
- Severe hepatic dysfunction or decompensated cirrhosis



Chronic HCV-infected patients

## DAA therapy era

- Cirrhotic
- Co-morbidities
- Renal impairment
- Psychiatric
- Drug user
- Transplant
- Decompensated cirrhosis

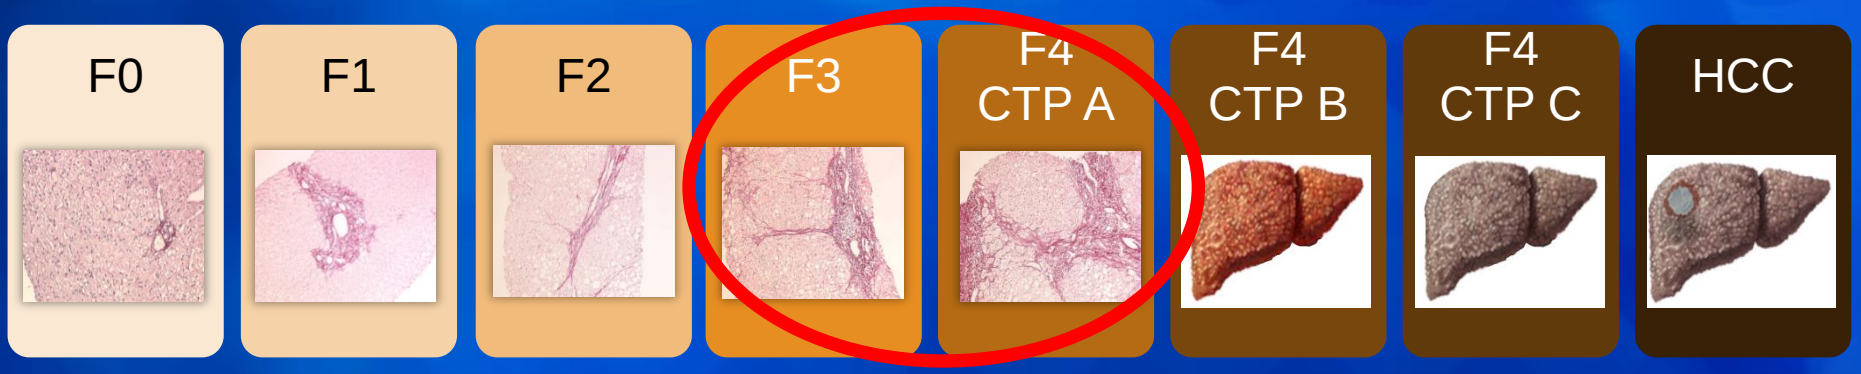
# Case

- 62 yr old man, white, Vietnam Vet
- HCV cirrhosis
- Mild ascites and encephalopathy
- MELD 25, albumin 2.8g/dl
- HCV relapse post IFN/RBV/TEL

# Case

- 62 yr old man, Vietnam Vet
- HCV cirrhosis
- Severe ascites and brittle HE
- MELD 32
- HCV relapse post IFN/RBV/TEL

# Improved efficacy and tolerability increases the populations we can treat

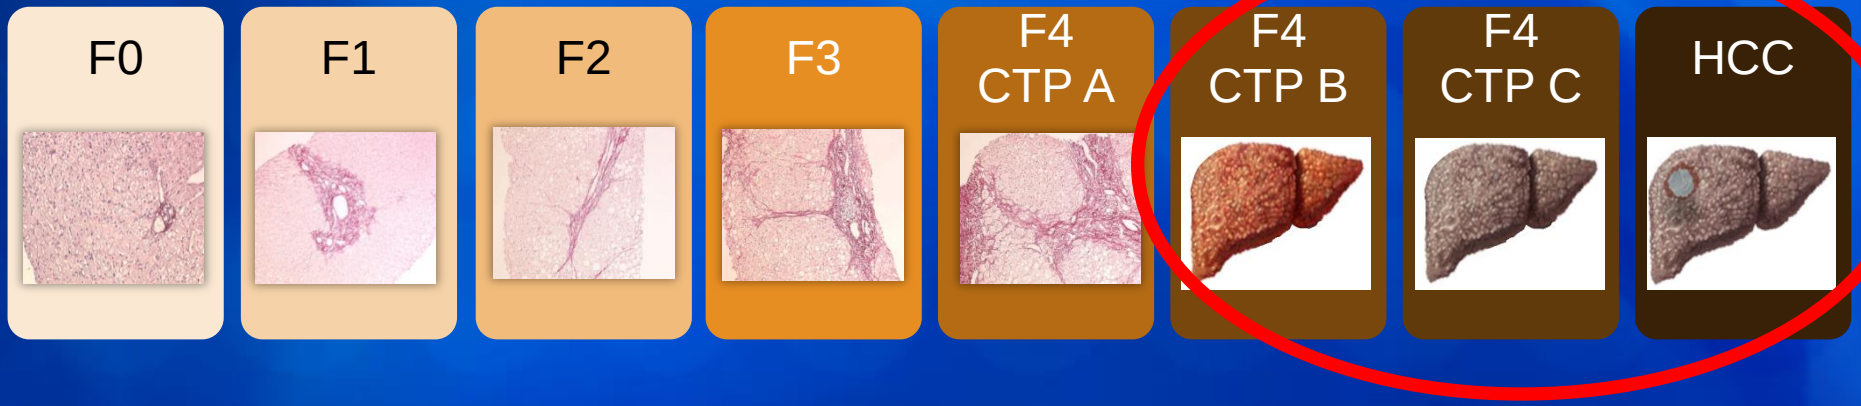


- **Previous therapy has been targeted to those at greatest need:**
  - **Advanced disease (F3/F4)**
  - **Severe extrahepatic manifestations/fatigue**

**Adapted from Asselah T, et al. J Hepatol 2014;61:193–5**

**CTP: Child–Turcotte–Pugh; F: fibrosis stage; GT: genotype; HCC: hepatocellular carcinoma**

# Improved efficacy and tolerability increases the populations we can treat



- Previous therapy has been targeted to those at greatest need:
  - Advanced disease (F3/F4)
  - Severe extrahepatic manifestations/fatigue
- New regimens are well tolerated in patients with advanced disease
  - Can they prevent death and need for liver transplant?

Adapted from Asselah T, et al. J Hepatol 2014;61:193–5

CTP: Child–Turcotte–Pugh; F: fibrosis stage; GT: genotype; HCC: hepatocellular carcinoma

# What drugs are safe?

| DAA Class | Name | $AUC_{24}$ (cf. healthy volunteers) | | |

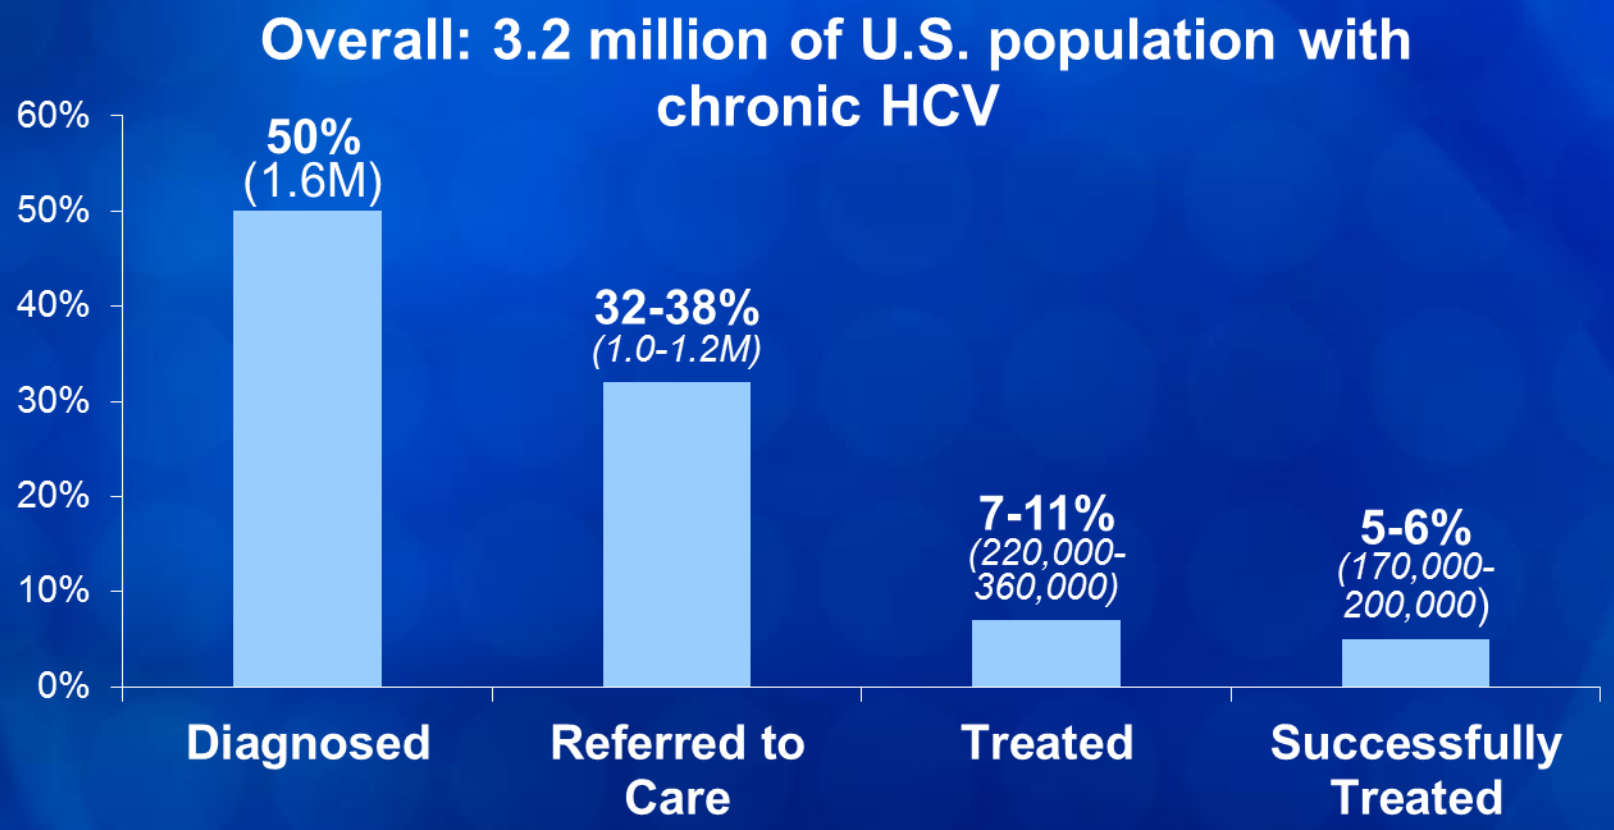
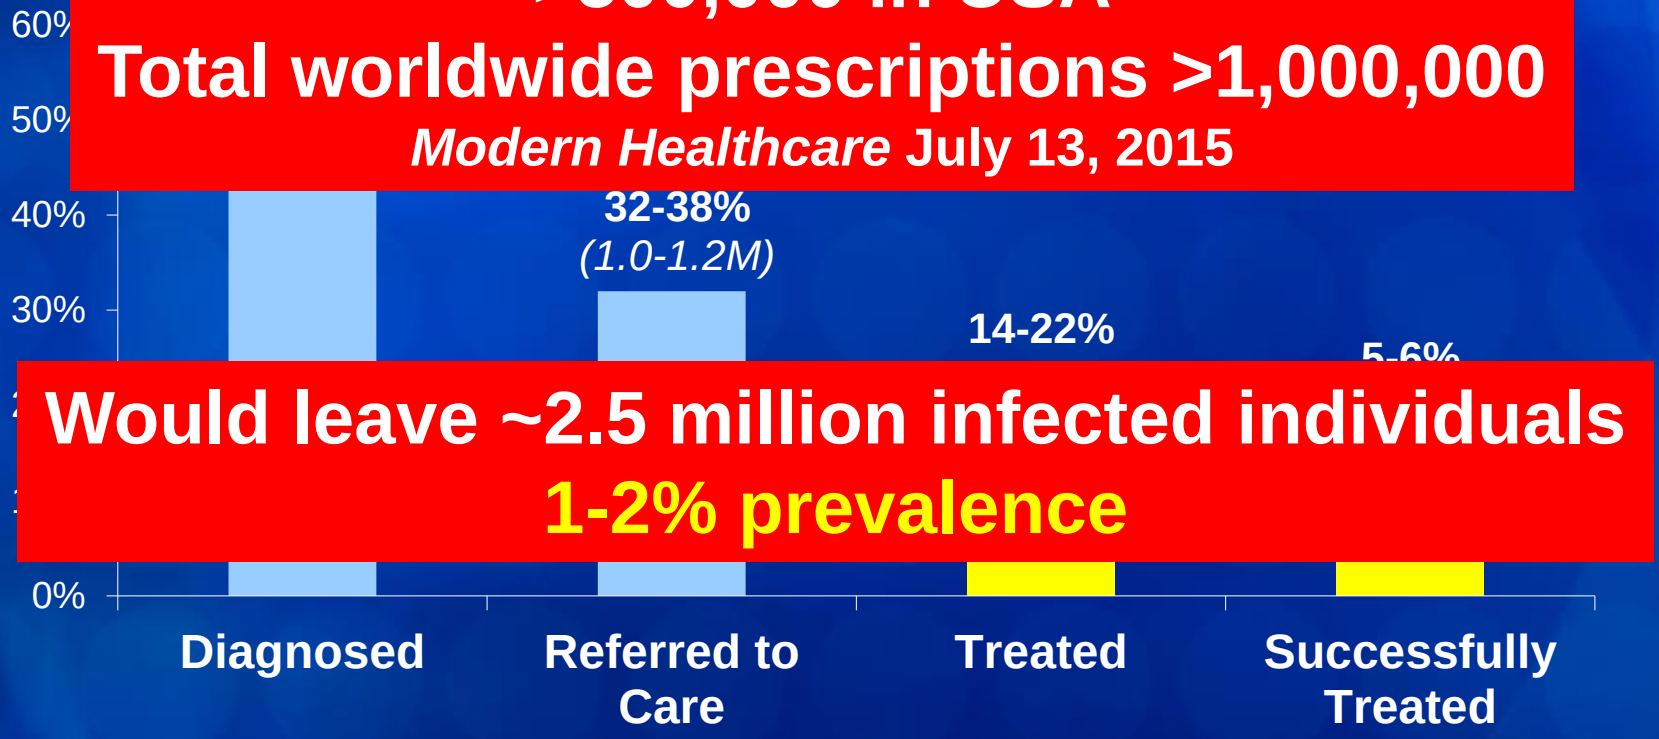
# Impact of Direct Acting Antivirals on Frequency of Treatment Utilization



Holmberg SD et al. *New Engl J Med*. 2013;368:1859-1861.

# Impact of Direct Acting Antivirals on Frequency of Treatment Utilization

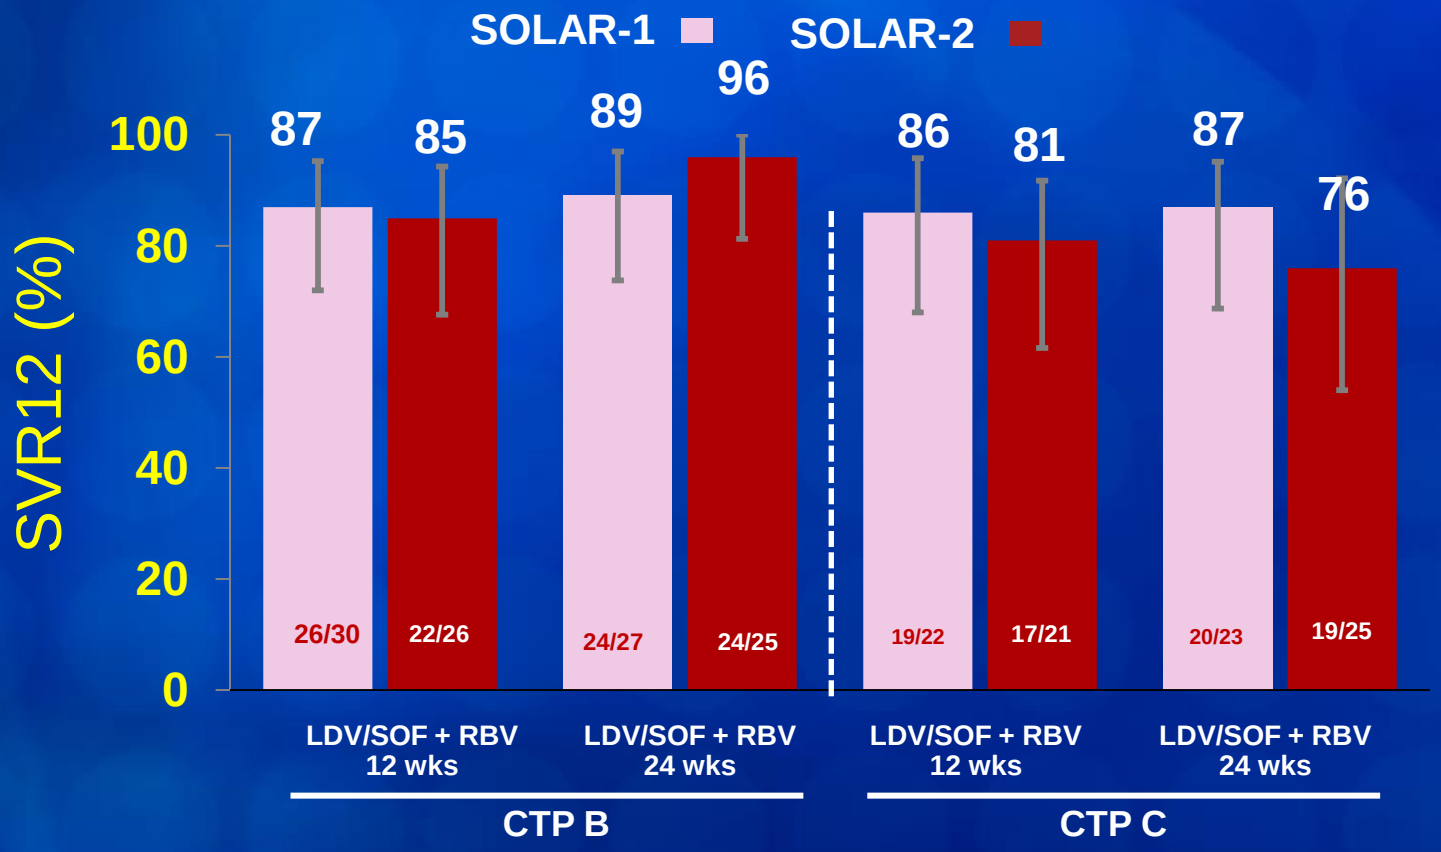
**Number of DAA prescriptions:**
**>500,000 in USA**
**Total worldwide prescriptions >1,000,000**
***Modern Healthcare* July 13, 2015**



**Would leave ~2.5 million infected individuals**
**1-2% prevalence**

Holmberg SD et al. *New Engl J Med*. 2013;368:1859-1861.

# SOLAR-1/2: Overall Efficacy Pre-LTx in GT 1 and GT 4



**Comparable efficacy between SOLAR-1 and SOLAR-2 studies**

Charlton M, et al. Gastroenterology 2015;149:649–59;
Manns M, et al. Lancet Infect Dis 2016;16:685–97

Error bars represent 90% confidence intervals

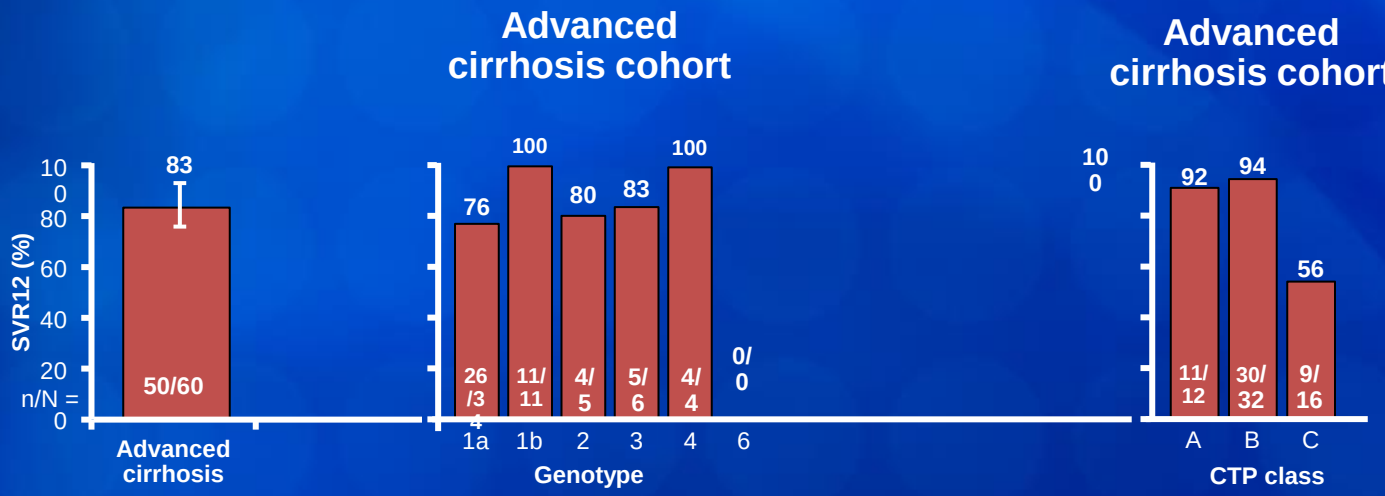
# SOLAR-1/2: Overall pre-LTx Safety Summary

| | Pre-Transplant |
|---|---|
| **Patients, n (%)** | **CTP B + C (n=215)** |
| Any AE | 208 (97) |
| Grade 3–4 AE | 51 (24) |
| Serious AE | 61 (28) |
| Serious treatment-related AE | 5 (2) |
| AE leading to D/C of LDV/SOF | 9 (4) |
| Death | 10 (5) |
| Rejection episode | 0 |
| Graft loss | 1 |
| Liver transplantation | 11 |

- **Treatment-related SAEs were mostly related to RBV treatment**
- **Deaths and AEs that led to D/C of LDV/SOF were not attributed to study treatment**

**Samuel D, et al. EASL 2015, P0774**

# ALLY-1: SOF + DCV in advanced cirrhosis



- In subgroup analysis of patients in the advanced cirrhosis group, those who were CTP class C (n = 16) or had albumin < 2.8 g/dL (n = 18) had SVR12 rates of 56%
- 10/10 patients who relapsed in the advanced cirrhosis group had NS5A RASs at virological failure; 4 of 10 patients had NS5A RASs at baseline

RAS: resistance-associated substitution

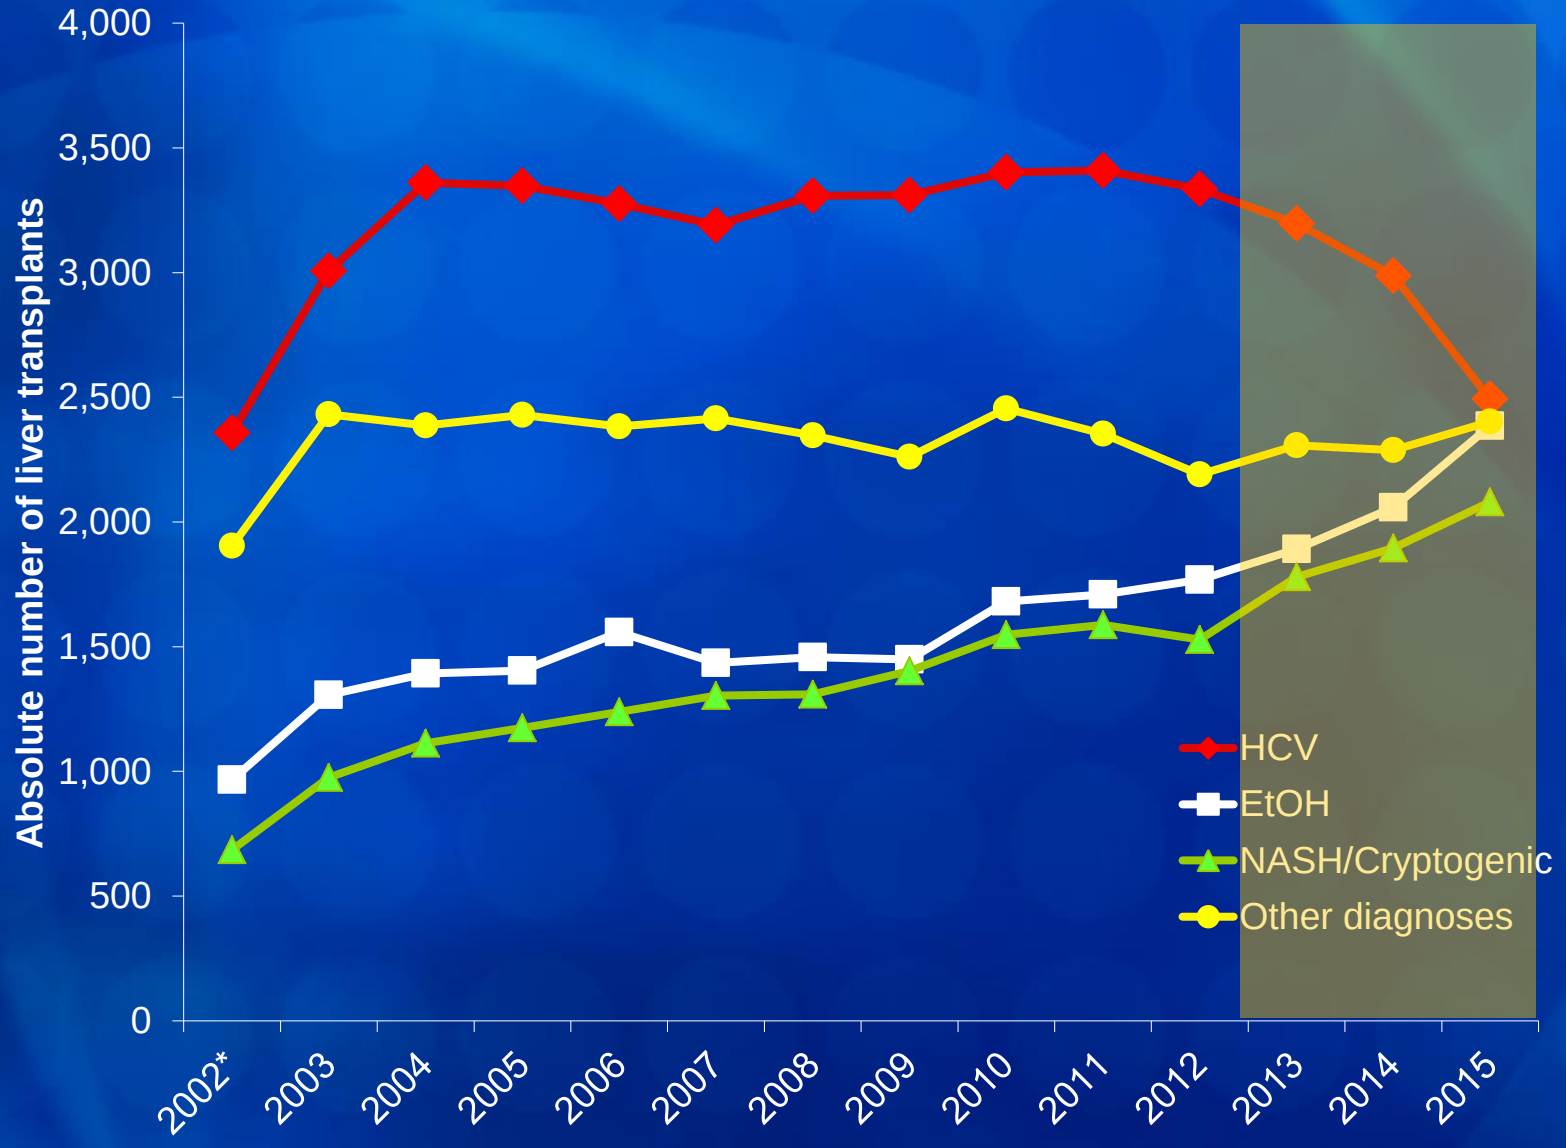
# Indications for Waitlisting for liver transplantation



**Goldberg et al., *Gastroenterology* 2017.**

# Conclusions

- HCV treatment should be considered in patients with decompensated liver disease with MELD scores </=30
- Treatment should be with SOF + LDV/VEL/DCV + RBV x 12 wks or SOF + LDV/VEL/DCV x 24 wks
- Decisions to treat should be individualized.
